Family Tree – a programming exercise

Attached to this document is a C++ header file defining a class modelling blood relations of a single person. The goal of the exercise is to write its implementation, i.e. the cpp file. Some points to note:

- If you need to make any assumptions, please choose them according to your best judgment.
- You can add new functionality to the class, but please don't change the existing interface.
- Please do not put any function called `main()` in the cpp file.
- Please do not modify the name of the cpp file.
- Please do not share this exercise with third parties.
